$$.20 \times 50 = 10$$

15% fewer doesn't mean $0.15p$
it means $(1 - 0.15)p$ or $0.85p$

Fractions

Every Number is Over "1."

$$-\frac{2}{3} = \frac{-2}{3} = \frac{2}{-3} \neq \frac{-2}{-3} \quad \frac{-2}{-3} = \frac{2}{3}$$

Factor trees:

Regardless of how you make the factor tree, you will always end up with the same prime factors

Pythagoras:

"c" is always the hypotenuse, the longest side
Bigger square – Smaller square = Other smaller square.

Square Roots (Radicals)

$$\begin{array}{l} 3 \times 3 = 9 \quad \sqrt{9} = 3 \\ 5 \times 5 = 25 \quad \sqrt{25} = 5 \end{array}$$

Can't square root a negative

$$\sqrt{-9} = \text{undefined}$$

The area of a square with side lengths 3 is 9.
The square root of 9 is 3.

Geometry

M8 - 3.0 - Pythagoras' Theorem Review

Pythagoras' Theorem: $a^2 + b^2 = c^2$

Remember: "c" is always the Hypotenuse: the longest side

$$9 \text{ squares} + 16 \text{ squares} = 25 \text{ squares}$$

$$\sqrt{25} = 5$$

Solve for "c".

$$a^2 + b^2 = c^2$$

$$3^2 + 4^2 = c^2$$

$$9 + 16 = c^2$$

$$25 = c^2$$

$$\sqrt{25} = \sqrt{c^2}$$

$$5 = c$$

Remember:

The Area of the two small squares adds to the area of the large square.

$$c = \sqrt{a^2 + b^2}$$

Solve for "a" or "b".

$$a^2 + b^2 = c^2$$

$$6^2 + b^2 = 10^2$$

$$36 + b^2 = 100$$

$$-36 \quad -36$$

$$b^2 = 64$$

$$\sqrt{b^2} = \sqrt{64}$$

$$b = 8$$

OR

Remember:

Bigger square minus smaller square equals other smaller square.

$$c^2 - a^2 = b^2$$

$$10^2 - 6^2 = b^2$$

$$100 - 36 = b^2$$

$$64 = b^2$$

$$\sqrt{64} = \sqrt{b^2}$$

$$b = 8$$

$$b = \sqrt{c^2 - a^2}$$

3. $2a = 4$

$$\frac{2a}{2} = \frac{4}{2}$$

Divide both sides by the number in front of the letter.

$$\frac{\cancel{2}a}{\cancel{2}} = \frac{4}{2}$$

$\frac{2}{2} = 1$. Cross it off.

$$a = 2$$

4. $\frac{a}{2} = 3$

$$2 \times \frac{a}{2} = 3 \times 2$$

Multiply both sides by the number below the letter.

$$\cancel{2} \times \frac{a}{\cancel{2}} = 3 \times 2$$

$\frac{2}{2} = 1$. Cross it off.

$$a = 6$$

5. $\frac{2}{a} = 1$

$$a \times \frac{2}{a} = 1 \times a$$

Multiply both sides by a .

$$\cancel{a} \times \frac{2}{\cancel{a}} = 1 \times a$$

$\frac{a}{a} = 1$. Cross it off.

$$2 = a$$

6. $x^2 = 25$

$$\sqrt{x^2} = \sqrt{25}$$

Square root both sides.

$$x = 5$$

$\boxed{1} = 1kg$

The Golden Rule: Whatever you do to the right side of the equal sign, do to the left side.

What plus 1 = 4?

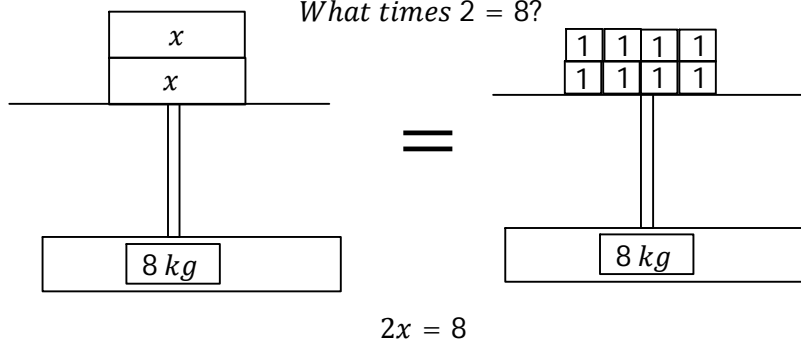

$$\begin{array}{r} x + 1 = 4 \\ -1 \quad -1 \\ \hline x = 3 \end{array}$$

Take off one from both sides

What times 2 = 8?

$$\begin{array}{r} \frac{2x}{2} = \frac{8}{2} \\ \hline x = 4 \end{array}$$

Divide both sides by two

M8 - 10.0 - Multiply By LCD Review

$$\begin{aligned}\frac{x}{2} + \frac{1}{4} &= \frac{3}{4} \\ \left(\frac{x}{2} + \frac{1}{4} = \frac{3}{4}\right) \times 4 & \\ 4x + 1 &= 12 \\ \frac{4x}{2} + \frac{1}{4} &= \frac{12}{4} \\ 2x + 1 &= 3 \\ -1 &-1 \\ 2x &= 2 \\ \frac{2x}{2} &= \frac{2}{2} \\ x &= 1\end{aligned}$$

Multiply by the LCD=4

$$\begin{aligned}\frac{x}{2} + \frac{1}{4} &= \frac{3}{4} \\ \frac{2 \times x}{2 \times 2} + \frac{1}{4} &= \frac{3}{4} \\ \frac{2x}{2x} + \frac{1}{4} &= \frac{3}{4} \\ \frac{2x}{4} + \frac{1}{4} &= \frac{3}{4} \\ \left(\frac{2x}{4} + \frac{1}{4} = \frac{3}{4}\right) \times LCD & \\ 2x + 1 &= 3 \\ -1 &-1 \\ 2x &= 2 \\ \frac{2x}{2} &= \frac{2}{2} \\ x &= 1\end{aligned}$$

Get an LCD then Multiply by the LCD

All three are the same question! Which solution do you like the best?

$$\begin{aligned}\frac{x}{2} + \frac{1}{4} &= \frac{3}{4} \\ 2x + 1 &= 3 \\ 2x &= 2 \\ x &= 1\end{aligned}$$

Instead of actually multiplying
by the LCD we are going to
multiply and simplify at the
same time.

$$\begin{aligned}\frac{x}{2} + \frac{1}{4} &= \frac{1}{2} \\ \left(\frac{x}{2} + \frac{1}{4} = \frac{1}{2}\right) \times LCD & \\ 4x + 1 &= 2 \\ \frac{4x}{2} + \frac{1}{4} &= \frac{2}{2} \\ 2x + 1 &= 2 \\ 2x &= 1 \\ x &= \frac{1}{2}\end{aligned}$$

LCD = 4

$$\begin{aligned}\left(\frac{x}{2} + \frac{1}{4} = \frac{1}{2}\right) \times LCD & \\ 2x + 1 &= 2 \\ 2x &= 1 \\ x &= \frac{1}{2}\end{aligned}$$

Instead of actually multiplying
by the LCD we are going to
multiply and simplify at the
same time.

M8 - 10.0 - Equations Theory Notes

What's the goal?

To get the letter by itself. (On top with a 1 in front)

Is it by itself?

Yes or no.

What is attached to it on its side of the equal sign?

What operation is being applied?

How do we cross it/them off?

What is the opposite operation?

Do the opposite to both sides.

Cross it off.

Repeat

$$x + 2 = 5$$

$$\begin{array}{rcl} x + 2 & = & 5 \\ -2 & -2 & \end{array} \quad \text{Subtract 2 from both sides.}$$

$$\begin{array}{rcl} x + 2 & = & 5 \\ -2 & -2 & \end{array} \quad \text{Plus 2 minus 2 equals 0, cross it off.}$$

$$x = 3$$

$$3x - 3 = 6$$

$$\begin{array}{rcl} 3x - 3 & = & 6 \\ +3 & +3 & \end{array} \quad \text{Add 3 to both sides.}$$

$$3x = 9$$

$$\begin{array}{rcl} \frac{3x}{3} & = & \frac{9}{3} \\ 3 & 3 & \end{array} \quad \text{Divide both sides by 3}$$

$$x = 3$$

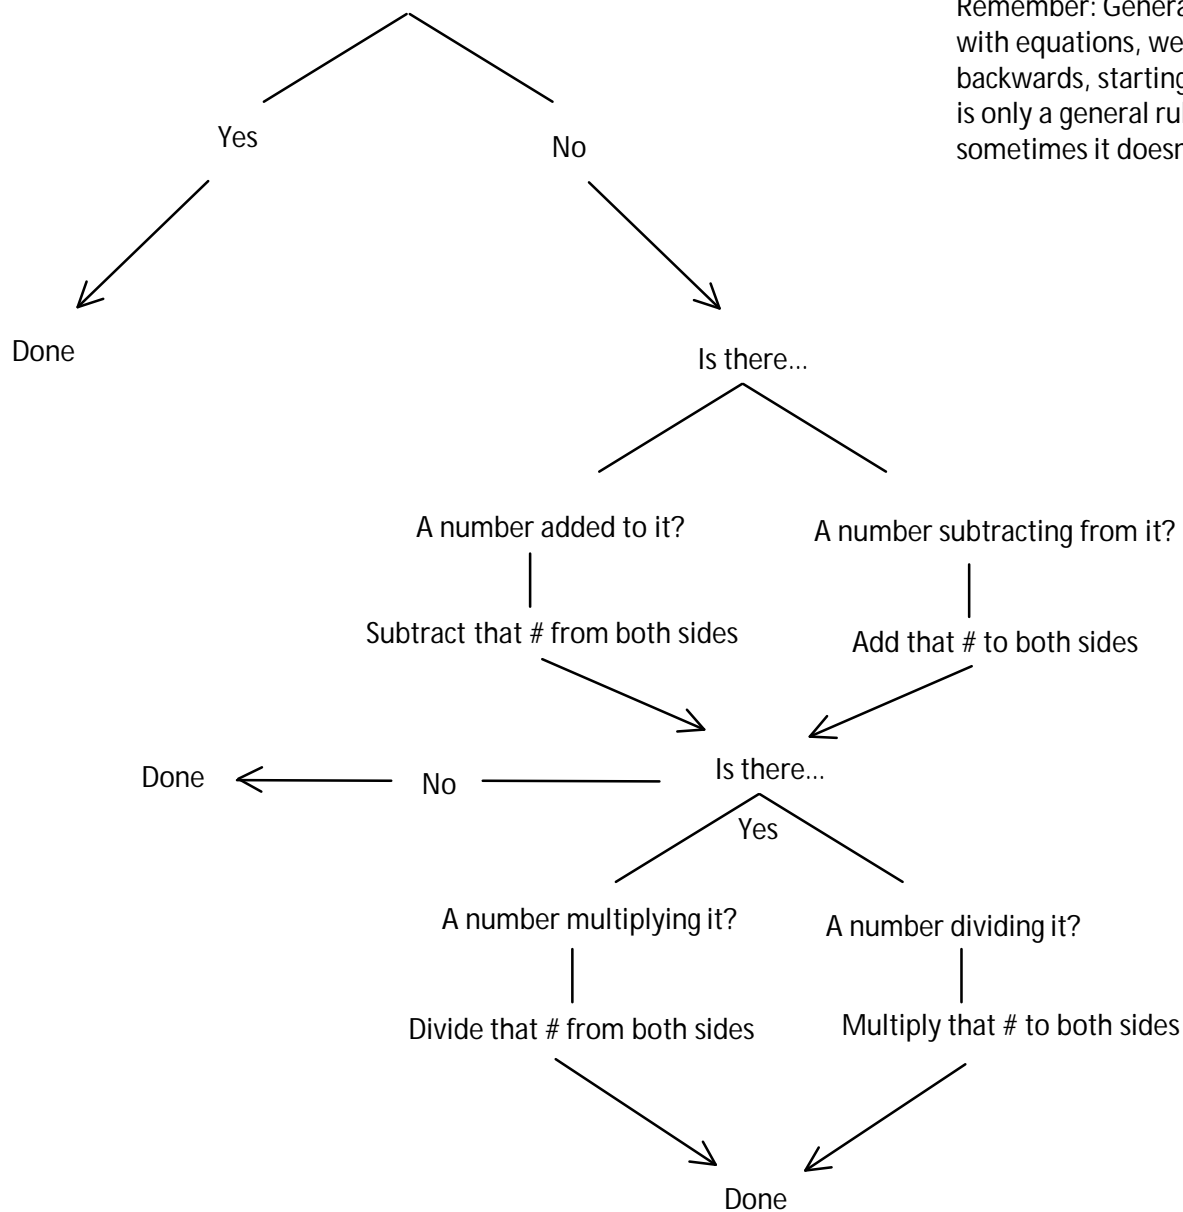

Remember: Generally, working with equations, we do BEDMAS backwards, starting with S. This is only a general rule, sometimes it doesn't hold true.
